

## **Adrian on Furl**

J: [The first question we have is how you approach a search]...what you are likely to do when you are sitting down...and you can envision it like for a class if that makes it easier for you, or a specific project that you've done.

A: It does totally depend on the subject that I'm researching...I have Google as my home page, so [laughs]. That's always a good start for anybody. I know for the project that I did for your class, my favorite research tool was something called Furl. Yeah, I kind of stumbled upon it on accident. It's F-U-R-L.com, and it's a search as well as a research tool. You have to do some installation on your computer, and what it does is...you can search through various databases. I think I was searching an article in a search engine, findarticle.com or something, for published articles and there was a button to like, FURL IT, and what it does is, you have it – the furl mechanism – installed on your computer, and you can save any page anywhere on the web, and you have...you can create your own database and everything. It's so good...it's so great...you have categories and keywords and everything. So that was my favorite thing that I found on that project.
